

EXE101 – CHECKPOINT 1

Lecturer: ThanhNTL2

STARTUP PROFILE

JobFree = Job + Freedom
Free from the constraints of work, work flexibly on your own schedule, and earn extra income anytime.

Name	Role	Core Responsibilities	Percentage of share
Phạm Hoàng Dinh	CEO / Backend Lead	Vision · Backend core · API & DB management · Coordination	18%
Nguyễn Đức Anh Tài	CPO / Frontend Lead	UX/UI flow · Prototype · Interface design · Product strategy	17%
Lê Ngọc Trí Tín	CTO / Backend Engineer	Backend dev · Technical architecture · Tech coordination	17%
Nguyễn Lê Thiện Sơn	CDO / Data & AI Analyst	Data analysis · User research · AI/matching logic	16%
Nguyễn Lê Bình	CMO / Marketing Lead	Marketing strategy · Target users · Growth & communication	16%
Trương Thiệu Như	CFO / Finance Lead	Pricing · Revenue model · Financial planning · Biz strategy	16%

Startup Values

Trust before Growth
We prioritize verified users, reliable matching, and platform safety.

Real Problem Solving
Focus on solving actual workforce challenges, not just building features.

Simple for Everyone
Keep the platform easy, clear, and efficient to use.

Worker Empowerment
Create accessible and flexible income opportunities for everyone.

Platform Transparency
No hidden fees, fake jobs, or unclear communication.

Sustainable Growth
We aim to build long-term value for workers, businesses, and the community.

IDEA 1: JOBFREE ON-DEMAND GIG PLATFORM

Job-to-be-done

When I suddenly need someone nearby to help with **a small real-world task**. I want to quickly find a trustworthy, available person at a price I'm comfortable with, so the task can be completed with **minimal waiting, negotiation, and uncertainty**.

Case: Mr Binh just moved and needs a reliable person to unpack and arrange his belongings for 2 hours this Saturday.

Mr Dinh who has free Saturday, wants to turn his free Saturday into cash

Idea Description

JobFree is a platform that matches short-term hourly or daily work, connecting quickly **those who need immediate labor** with those who have **free time** and want to **earn extra income**.

Real-time Matching Engine: availability & location in real-time
Workers scheduling: workers can set their available time and optimize matching
Employers budget setting: Employer can set **price for a task**

Key dimensions	Assessment	Assessment rating
Desirability	User segments: B2C: Busy Urban residents, students B2B: Delivery hub, Event organizers, small business,... Frequency: High repeat usage for convenience and recurring support tasks. On-demand, situational usage for urgent or unexpected needs.	High
Feasibility	We are offering an on-demand local task marketplace that instantly connects people and small businesses with nearby workers who can help complete short-term, real-world tasks quickly and flexibly.	Medium
Viability	Technology-based services are blooming and becoming a staple of the modern Vietnamese gig economy . Core revenue from transaction commission, service fee,...	Medium
Suitability	The idea fits the team because IT members can handle backend architecture, automated matching logic, and secure database connections, while business members can research target customers, revenue modeling, and go-to-market strategy.	High
Capability	The team is capable of building prototypes and validating MVPs. External resources: eKYC, payment platform, map API	Medium
AI Proof	AI can supports products but does not replace trust networks and real transactions.	Medium

IDEA 2: MEDGUARD SMART MEDICINE BOX

Job-to-be-done

When elderly people with chronic diseases need to take medicine every day, they need a simple and reliable way to take **the right medicine, at the right time, and in the right dosage** without depending completely on family members.

Case: Mr. Tung, around 49 years old, has heart disease and needs to take his medicine every day at the exact time instructed by his doctor. However, because he is still working and has a busy schedule, he sometimes forgets when to take his medicine or cannot remember whether he has already taken it or not.

Idea Description

MedGuard is a smart medicine box that helps elderly users take medicine correctly through **automatic reminders, medicine compartment control, and family monitoring via mobile app**.

Smart reminder: The box reminds users with sound, light, or voice when it is time to take medicine.

Medicine compartment control: The correct compartment opens at the scheduled time to reduce wrong dosage.

Mobile app connection: Family members can check whether the medicine was taken or missed.

Alert system: If the elderly user misses a dose, the system sends a notification to family members.

Key dimensions	Assessment	Assessment rating
Desirability	Target users are elderly people with chronic diseases such as high blood pressure, diabetes, or heart disease. They need to take medicine daily , often 2–4 times per day, so the usage frequency is high and the need is essential .	Medium
Feasibility	Can be built with IoT, mobile app, and database . To ensure stable usage, the system includes battery backup for power continuity and offline memory to save medicine records when Wi-Fi is unavailable.	High
Viability	Revenue can come from selling the smart box, subscription for app monitoring, and partnerships with pharmacies or clinics .	High
Suitability	IT members can handle IoT, app development, and cloud connection , while business members can research customers, pricing, and go-to-market strategy .	Medium
Capability	The team can build an MVP in 3 months with basic features: reminder, medicine box opening, missed-dose tracking, and app notification . External resources may be needed for medical consultation and hardware testing.	Medium
AI Proof	AI can support reminders and data analysis, but it cannot replace the physical medicine-dispensing function . The product has hardware design, medicine compartment mechanism, and user data system, so it is harder for AI alone to replace.	High

AI DISCLOSURE STATEMENT

Team **JobFree** confirms that it used artificial intelligence (AI) tools to assist in the development and presentation of the **JobFree** project idea, including:

- **ChatGPT (OpenAI):** Support brainstorming, business idea analysis, problem-solution fit identification, presentation content development, and business model refinement.

- **ZincBot / AI Notebook** (Team-developed Tool): The AI tool, developed by our team, is used to support research for the project and manage/store the team's internal documents.

AI is used solely as a tool to support research, idea development, and content design. The team is responsible for reviewing, selecting, editing, and confirming all final content before it is included in the presentation.

THE FINAL IDEA, DECISION, EVALUATION AND PRESENTATION ARE THE RESPONSIBILITY OF THE TEAM
